New Plans: Five Complementary Business Models

Options to cut price risk and capital needs — based on fundraising-guide lessons

September 2026

Exchange rate: 1 USD = 235,000 Toman (28 Sep 2026). All figures are estimates to be confirmed by quotes and contracts.

Why new models?

• Main critique: profit depends on the granule-waste spread; a 15% price drop means a loss.

• Thiel: big share of a small market first. Floodgate: 'proprietary power' means not needing to compete — for us, waste supply.

• The models below either cut price risk, need less capital, or raise margins.

Comparing the five models

Model	Extra capex	Revenue	Price risk	Sanctions fit
A) Toll processing	None	40–45k Toman fee per kg	Very low	●●●
B) Buying-station network (franchise)	1–2 bn per station	5–8k Toman/kg margin + cheaper waste for the plant	Low	●●●
C) Producer compliance service (Art. 12)	Low (software, audit)	Recycling certificates sold to packaging producers	Low	●●●
D) Integration: garbage bags / pipe	10–15 bn	30–50% value added on granule	Medium	●●○
E) Mobile baler/shredder for small towns	3–5 bn per unit	Lower haulage, more waste	Low	●●○

Explanation: All figures in this table are first estimates and must be confirmed with real quotes.

A) Toll processing

• The waste owner (factory, dealer) brings material; we return granule for a fee.

• Pro: no waste purchase and no granule price risk; near-zero working capital.

• Use: fill idle capacity in year 1 (40% utilisation) — mix 30% toll + 70% own trading.

B) Buying-station network

• Small neighbourhood stations buy waste from pickers and residents at a fixed price, sort and bale it.

• Franchise: the local partner funds the station; we provide brand, training and guaranteed purchase.

• This is the proprietary supply power — the direct answer to Game 1 (waste competition) in the game-theory report.

C) Producer compliance service

• Under bylaw Art. 12, producers that don't recycle pay a levy.

• Offer: direct contracts with packaging producers to recycle an equivalent tonnage + auditable certificate.

• Revenue independent of granule prices — similar to Turkey's ÇEVKO model.

D) Making garbage bags or pipe

• After the granule market saturates (year 3+), part of the granule becomes a final product.

• Ready customers: the municipality (garbage bags) and farmers (irrigation pipe).

E) Mobile unit for small towns

• A truck with a baler and shredder compacts waste from nearby small towns so hauling to the plant pays off.

Recommended combination

When	Model	Goal
Year 1	Pilot + A (toll) + 3 stations B	Fill capacity, cheap waste
Year 2	+ C (producer compliance)	Price-independent revenue
Year 3+	+ D (bags/pipe) and E (mobile) + 10 cities	Higher margin, growth

Explanation: With this mix, even in the pessimistic case (granule at 85k), toll and compliance revenue cover part of fixed costs, so the plan no longer hangs on one price.
