

GreenPars Recycling

We turn city plastic waste into granule 20% cheaper than virgin polymer for Iranian factories.

Ask: 31 bn Toman (≈ $132K) for the Mashhad pilot plant

Problem

~20,000 t of plastic is dumped daily while factories pay high prices for raw material.

- Landfilling plastic: cost for cities, soil and water pollution
- Virgin petrochemical polymer is expensive and volatile with the currency
- Existing recycled granule has inconsistent quality (informal workshops)

Solution

Washed, melt-filtered granule with consistent quality and a lab certificate per batch.

Sort → shred → hot wash → dry → extrude + melt filter → granule

20% cheaper than virgin

Reliable delivery on 6-month contracts

Why now?

New law, an active fund and expensive virgin polymer — the window is open.

- Waste law bylaw: Art. 17 maximum facilities, Art. 12 recyclers' share of levies
- National Environment Fund has opened recycling loans (iranemp.ir)
- Sanctions make imports harder; local equipment and materials are now an advantage

Market

Demand isn't the limit; clean waste supply is — we solve it with municipal contracts.

Layer	Volume	Meaning
National plastic waste	~20,000 t/day	TAM
10 target cities	~92 t/day	SAM
Mashhad pilot	~4 t/day input	SOM

Business model

Per kg: buy waste at 45k → sell granule at 100–135k Toman.

Scenario	Granule/waste (k Toman)	Payback
Pessimistic	85 / 45	Loss
Base	100 / 45	5.3 yrs
Target	110 / 35	2.1 yrs
Optimistic	115 / 45	2.5 yrs

We don't hide the risk: a 15% granule price drop means a loss — so pre-sales and a waste contract are start conditions.

Traction so far

Before the money, we have de-risked — and planned the next 90 days with measurable outputs.

Item	Status
Technical partner & realistic financial model	✓ Done
7 formal letters (fund, bank, city, buyers)	✓ Ready to send
Written Pendar quote	Month 1
3 purchase letters of intent	Month 2
Mashhad waste agency MoU	Month 3

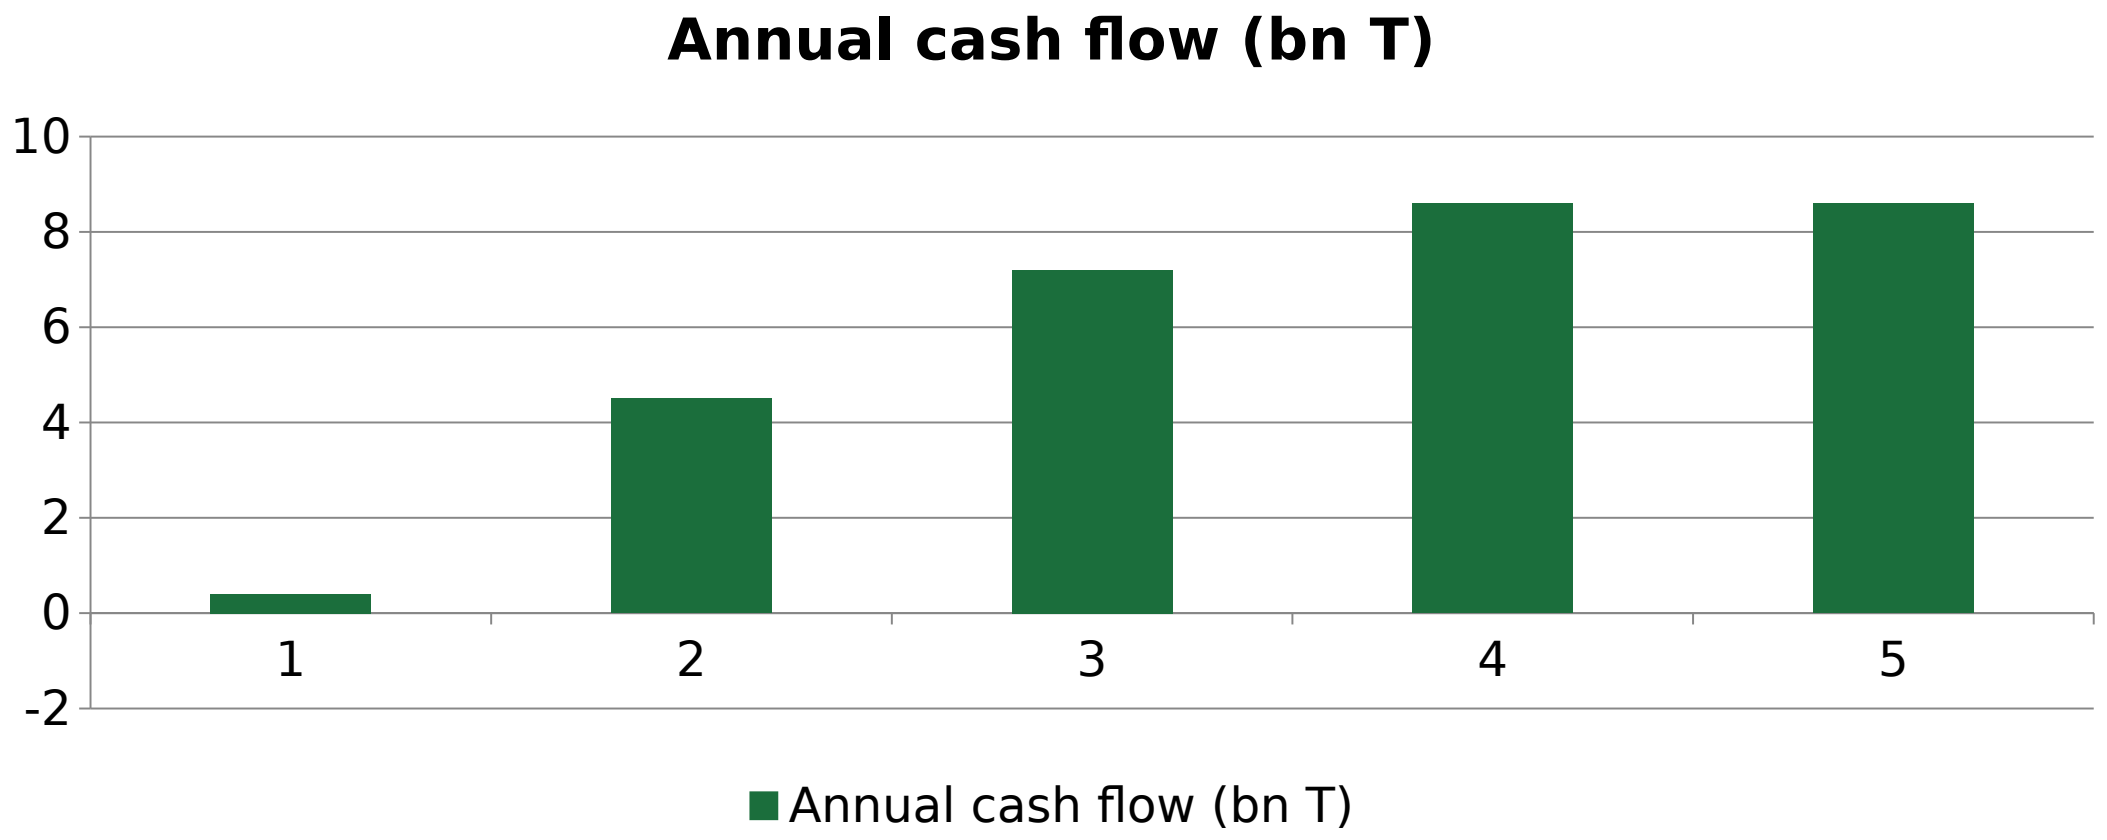

Competition

Near-virgin quality at workshop prices.

	Quality	Price	Supply reliability
Informal workshop	Low	Cheap	Low
Virgin polymer	High	Expensive	Medium (FX)
GreenPars	High ✓	20% cheaper ✓	Municipal contract ✓

Financial projection

Break-even in year 2; payback 5.3 yrs base, 2.1 yrs target.

Staged growth path

Each phase starts only after passing a decision gate.

Phase	Capex	Payback	Jobs
Mashhad pilot	$132K	2.1–5.3 yrs	~20
10 cities	$3.0M	2.3–4.7	211
Half of cities	$24.9M	3.2–7.5	2,890

Gate: waste ≤40k, granule ≥105k Toman, 6 consecutive profitable months.

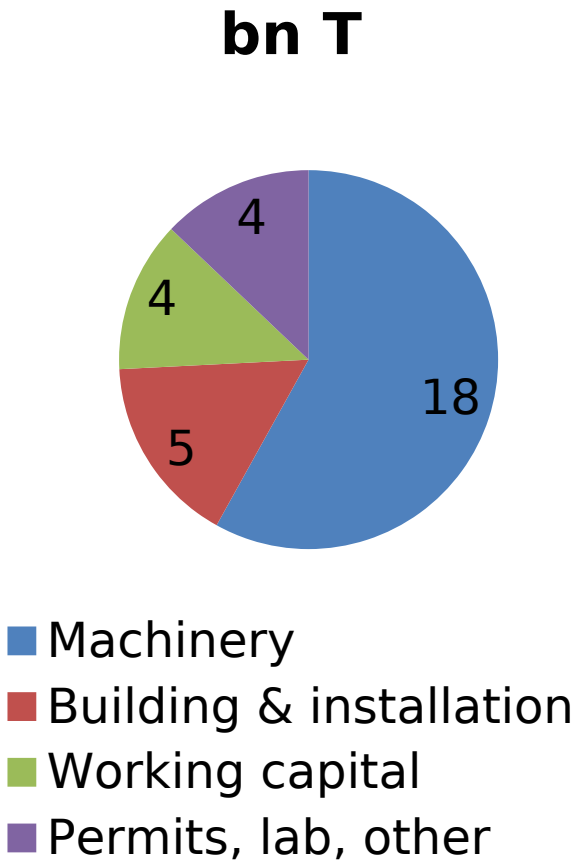

Team

Founding team + a technical partner with 20 years' experience; two key hires with this round.

Role	Name	Background
CEO / founder	[ ]	[ ]
Technical partner	Hamidreza Panahandeh — Pendar Polymer	~25 workshops built
Production manager (hire)	—	Month 2
Sales manager (hire)	—	Month 3

The ask and use of funds

31 bn Toman → one running plant, ~1,100 t granule/yr, ~20 jobs.

Sources:

- Founders 31%
- Pendar instalments 21%
- Environment Fund 32%
- Crowdfunding 16%

For an investor: 5 bn Toman = 15–20% equity

Risks — stated openly

Three big risks and our answer to each.

Risk	Response
Granule price	6-month pre-sales with 3 buyers
Waste supply	Municipal MoU + buying stations
Sanctions and banking	100% domestic model; foreign partner only as buyer/barter

Next step

A 30-minute meeting + a visit to Pendar Polymer's workshop.
